

ABSTRACT

There is disclosed a toothbrush holder system that consists of three basic parts. There is a wall mounted box-type receiver that receives a second L-shaped unit with a downwardly depending element and a third clamping element retainer the second element within the box-type receiver. The L-shaped unit includes a horizontally extending extension having receptacles therein for receiving toothbrushes. The L-shaped unit has a vertically depending element that is removably being clamped within the wall mounted box-type receiver that. The L-shaped unit can easily be separated from the box-type receiver. It is normally encased in a sanitized wrapper and is only installed when new residents occupy a previously vacated bathroom in a motel or hotel. In this manner, the toothbrush itself is always protected from any bacteria present on the toothbrush holders present in any commercial establishments.
